COMPUTER NETWORKS

Submitted by

Krish R Sakriya (1BM20CS076)

in partial fulfilment for the award of the degree of BACHELOR OF ENGINEERING
in
COMPUTER SCIENCE AND ENGINEERING

B.M.S. COLLEGE OF ENGINEERING BENGALURU-560019 October-2022 to Feb-2023

(Autonomous Institution under VTU)

B. M. S. College of Engineering,

Bull Temple Road, Bangalore 560019

(Affiliated To Visvesvaraya Technological University, Belgaum)

Department of Computer Science and Engineering

CERTIFICATE

This is to certify that the Lab work entitled "COMPUTER NETWORKS" carried out by Krish R Sakriya (1BM20CS076), who is bonafide student of B.M. S. College of Engineering. It is in partial fulfilment for the award of Bachelor of Engineering in Computer Science and Engineering of the Visvesvaraya Technological University, Belgaum during the year 2022. The Lab report has been approved as it satisfies the academic requirements in respect of a Computer Networks- (20CS5PCCON) work prescribed for the said degree.

Aim of the Experiment

Implement Dijkstra's algorithm to compute the shortest path for a given topology.

Code

```
#include
<stdio.h>
            #define INFINITY 9999
            #define MAX 10
            void Dijkstra(int Graph[MAX][MAX], int n, int start);
            void Dijkstra(int Graph[MAX][MAX], int n, int start) {
             int cost[MAX][MAX], distance[MAX], pred[MAX];
             int visited[MAX], count, mindistance, nextnode, i, j;
             // Creating cost matrix
             for (i = 0; i < n; i++)
             for (j = 0; j < n; j++)
             if (Graph[i][j] == 0)
             cost[i][j] = INFINITY;
             else
             cost[i][j] = Graph[i][j];
             for (i = 0; i < n; i++) {
             distance[i] = cost[start][i];
             pred[i] = start;
             visited[i] = 0;
             }
             distance[start] = 0;

Aim of the Experiment

Write a program for congestion control using leaky bucket algorithm.

CODE

```
#include<stdio.h>
                    #define bucketSize 500
                    void bucketInput(int a,int b)
                           if(a > bucketSize)
                                   printf("\n\t\tBucket overflow");
                           else{
                                   while(a > b){
                                          printf("\n\t\t%d bytes outputted.",b);
                                          a-=b;
                                   }
                                   if(a > 0)
                                          printf("\n\t\tLast %d bytes sent\t",a);
                                   printf("\n\t\tBucket output successful");
                            }
                    }
                    int main()
                           int op,pktSize;
                           printf("Enter output rate : ");
                           scanf("%d",&op);
                           for(int i=1;i<=5;i++)
                           {
                                   pktSize=rand()%700;
                                   printf("\nPacket no %d \tPacket size = %d",i,pktSize);
                                   bucketInput(pktSize,op);
                            }
                           return 0;
                    }
```

OUTPUT:

```

Aim of the Experiment

Using TCP/IP sockets, write a client-server program to make client sending the file name and the server to send back the contents of the requested file if present.

Code

```
Server:

from socket import * serverName = " serverPort =

12530 serverSocket =

socket(AF_INET,SOCK_STREAM)

serverSocket.bind((serverName,serverPort))

serverSocket.listen(1) print("The server is ready to

receive") while 1:

connectionSocket, addr = serverSocket.accept()

sentence = connectionSocket.recv(1024).decode() try:

file = open(sentence,"r") 1 =

file.read(1024)

connectionSocket.send(l.encode())

file.close() except Exception as e:

message = "No such file exist"

connectionSocket.send(message.encode()) connectionSocket.close()
```

```
Client: from socket import *
serverName = '192.168.1.104'
serverPort = 12530
clientSocket = socket(AF_INET, SOCK_STREAM)
```

```
clientSocket.connect((serverName,serverPort))
sentence = input("Enter file name")
clientSocket.send(sentence.encode()) filecontents =
clientSocket.recv(1024).decode() print ('From
Server:', filecontents) clientSocket.close()
```

```
C:\Users\Bhargava\Downloads>python clitcp.py
Enter file namemain.cpp
From Server: #include <bits/stdc++.h>
using namespace std

class Node{

    bool color = 0; // 1 -> black; 0 -> red
    Node *left = NULL;
    Node *right = NULL;
    Node *parent = NULL;
    int key;

    Node(int k)
    {
        key = k;
    }
};
```

Aim of the Experiment

Using UDP sockets, write a client-server program to make client sending the file name and the server to send back the contents of the requested file if present.

Code

```
Server:
from socket import * serverPort
= 12000
serverSocket = socket(AF_INET, SOCK_DGRAM)
serverSocket.bind(("127.0.0.1", serverPort))
print("The server is ready to receive") while 1:
sentence, clientAddress = serverSocket.recvfrom(2048)
file=open(sentence,"r")
l=file.read(2048)
serverSocket.sendto(bytes(1,"utf-8"),clientAddress)
print("sent back to client",l) file.close() Client:
from socket import * serverName = "127.0.0.1"
serverPort = 12000 clientSocket =
socket(AF_INET, SOCK_DGRAM)
sentence = input("Enter file name") clientSocket.sendto(bytes(sentence, "utf-8"), (serverName,
serverPort)) filecontents, serverAddress = clientSocket.recvfrom(2048) print ('From Server:',
filecontents)
clientSocket.close()
```
